

Workdone:

- Worked on AbsFit Project:
 - Showing status enquiry in a member in home page search option -
 - This is not an issue because we chose data from two tables. So in one table user have submitted enquiry and in other table user has become member. Few days back I was listing both the rows but concern came that only one row should be shown for each user so I thought I have to show Enquiry. Now I have removed the extra table that was causing the issue and tested the search functionality for around 10 member and 5 enquiries. It is working fine.

- Salary calculation for inactive employees till the date when they were active.
 - To achieve this, I have added a date input in the employee profile. Admins can enter a date when they inactivate any employee. If they don't set any dates, by default it will be today's date.
 - Accordingly I have written logic in Employees salary sheet page. Salary will be shown for an inactive employee if the inactivation date is greater than or equal to first day of the month.

- In current scenario, for old inactive employees the salary is visible because the inactivation date is blank. Admins can change inactivation date to any date whenever they want.
- Video link for the developed functionality. In the video, I have taken an inactive employee and changed his inactivation date to June 29, 2023. As a result, the inactive employee was only visible in June and not in July.
